

SQUV & PCA: reduction tools for THÈMIS

by

A. Sainz Dald & A. López Ariste

WHAT IS SQUV?

- Stokes Quick Viewer is a tool for the THÈMIS MTR data.
- It is a set of IDL routines and functions with a GUI.
- The input are the THÈMIS data; the output is a standard fits file with the Stokes parameters.
- It is stable, easy and for general porpouse use.
- It is one more code for THÈMIS data, my best reduction code.
- It is not perfect! I try to improve but it will not be perfect!

WHAT IS NOT SQUV?

- It is NOT a scientist!! It does NOT Science.
- It is NOT perfect! I try to improve but it will not be perfect!

HOW DOES IT WORK?

Scan_j

$$\text{Scan } P = I + S_i^{(i)}$$

$$\text{Scan } M = I - S_i$$

$$FF = \left(\sum_j FF_j \right) / n$$

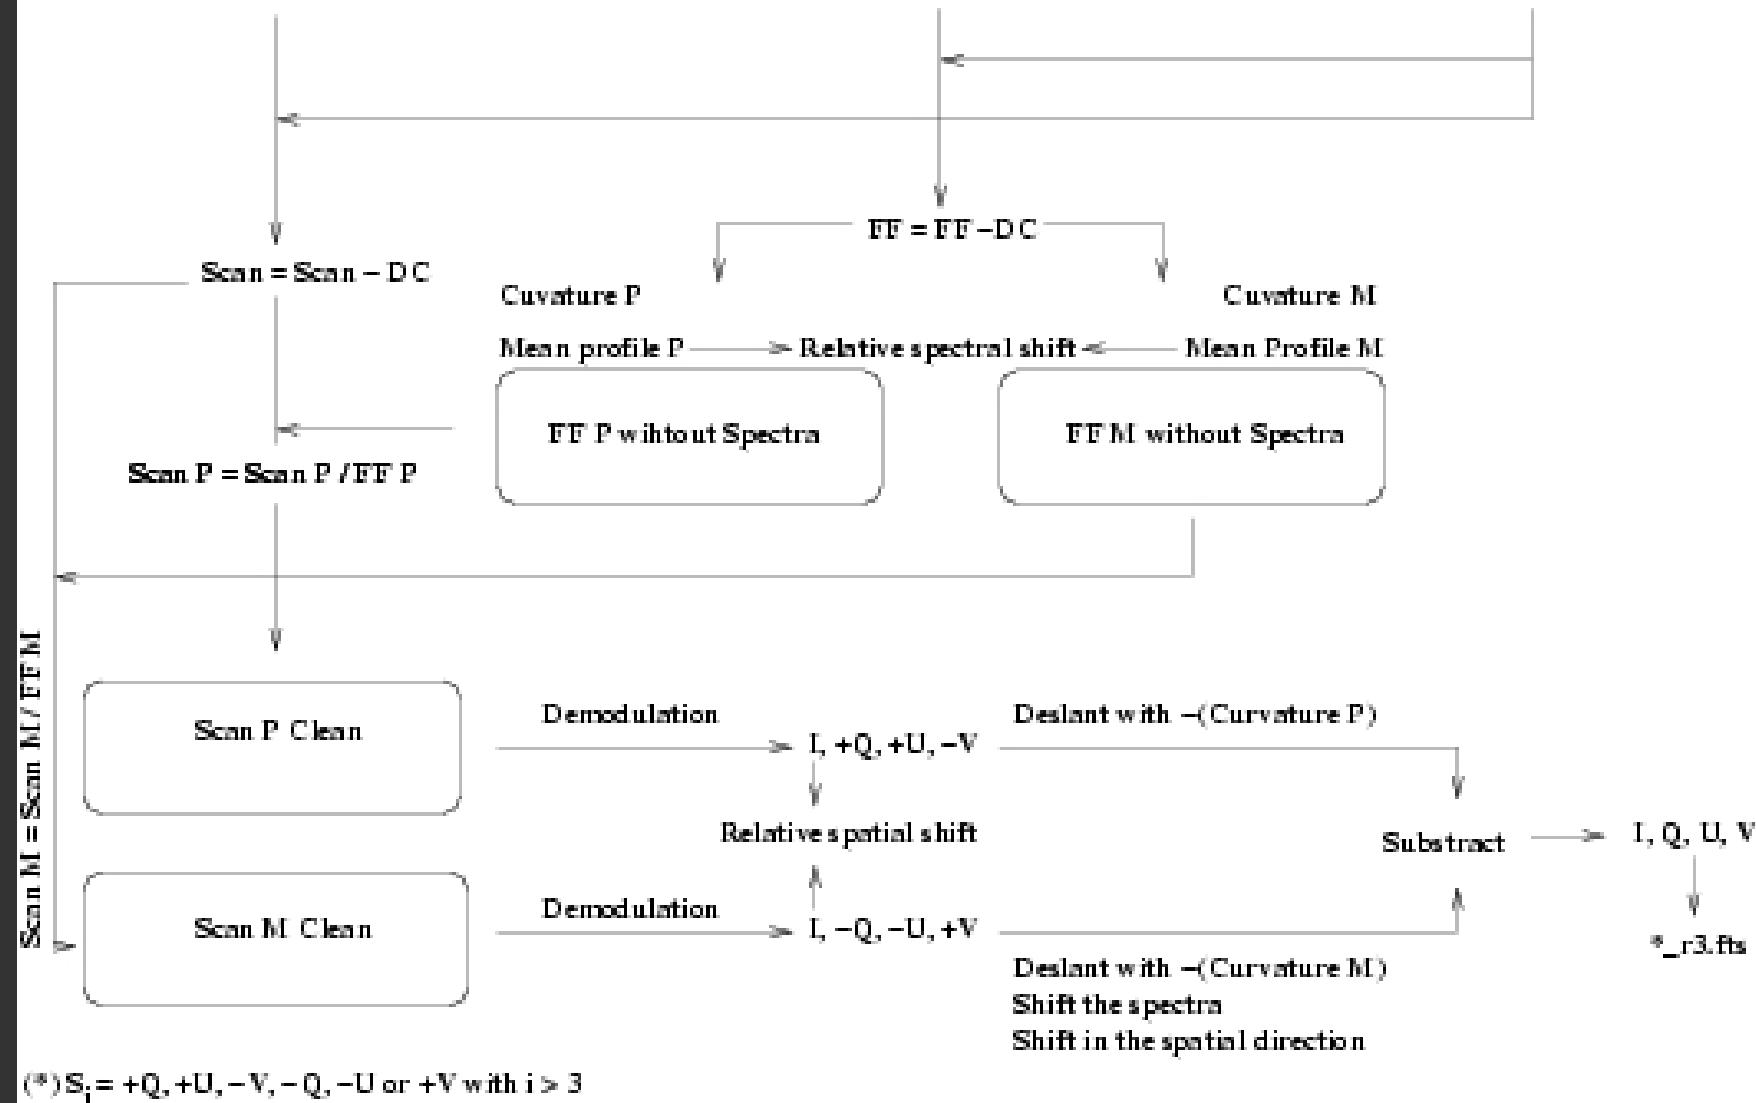

$$FF P = I + S_i$$

$$FF M = I - S_i$$

$$DC = \left(\sum_j DC_j \right) / n$$

DCP

DCM

(*) $S_i = +Q, +U, -V, -Q, -U$ or $+V$ with $i > 3$

THE FFs

Obteniendo FF Vía Superior 6302 Å

FF

HOW DOES IT WORK?

Scan_j

$$\text{Scan } P = I + S_i^{(i)}$$

$$\text{Scan } M = I - S_i$$

$$FF = \left(\sum_j FF_j \right) / n$$

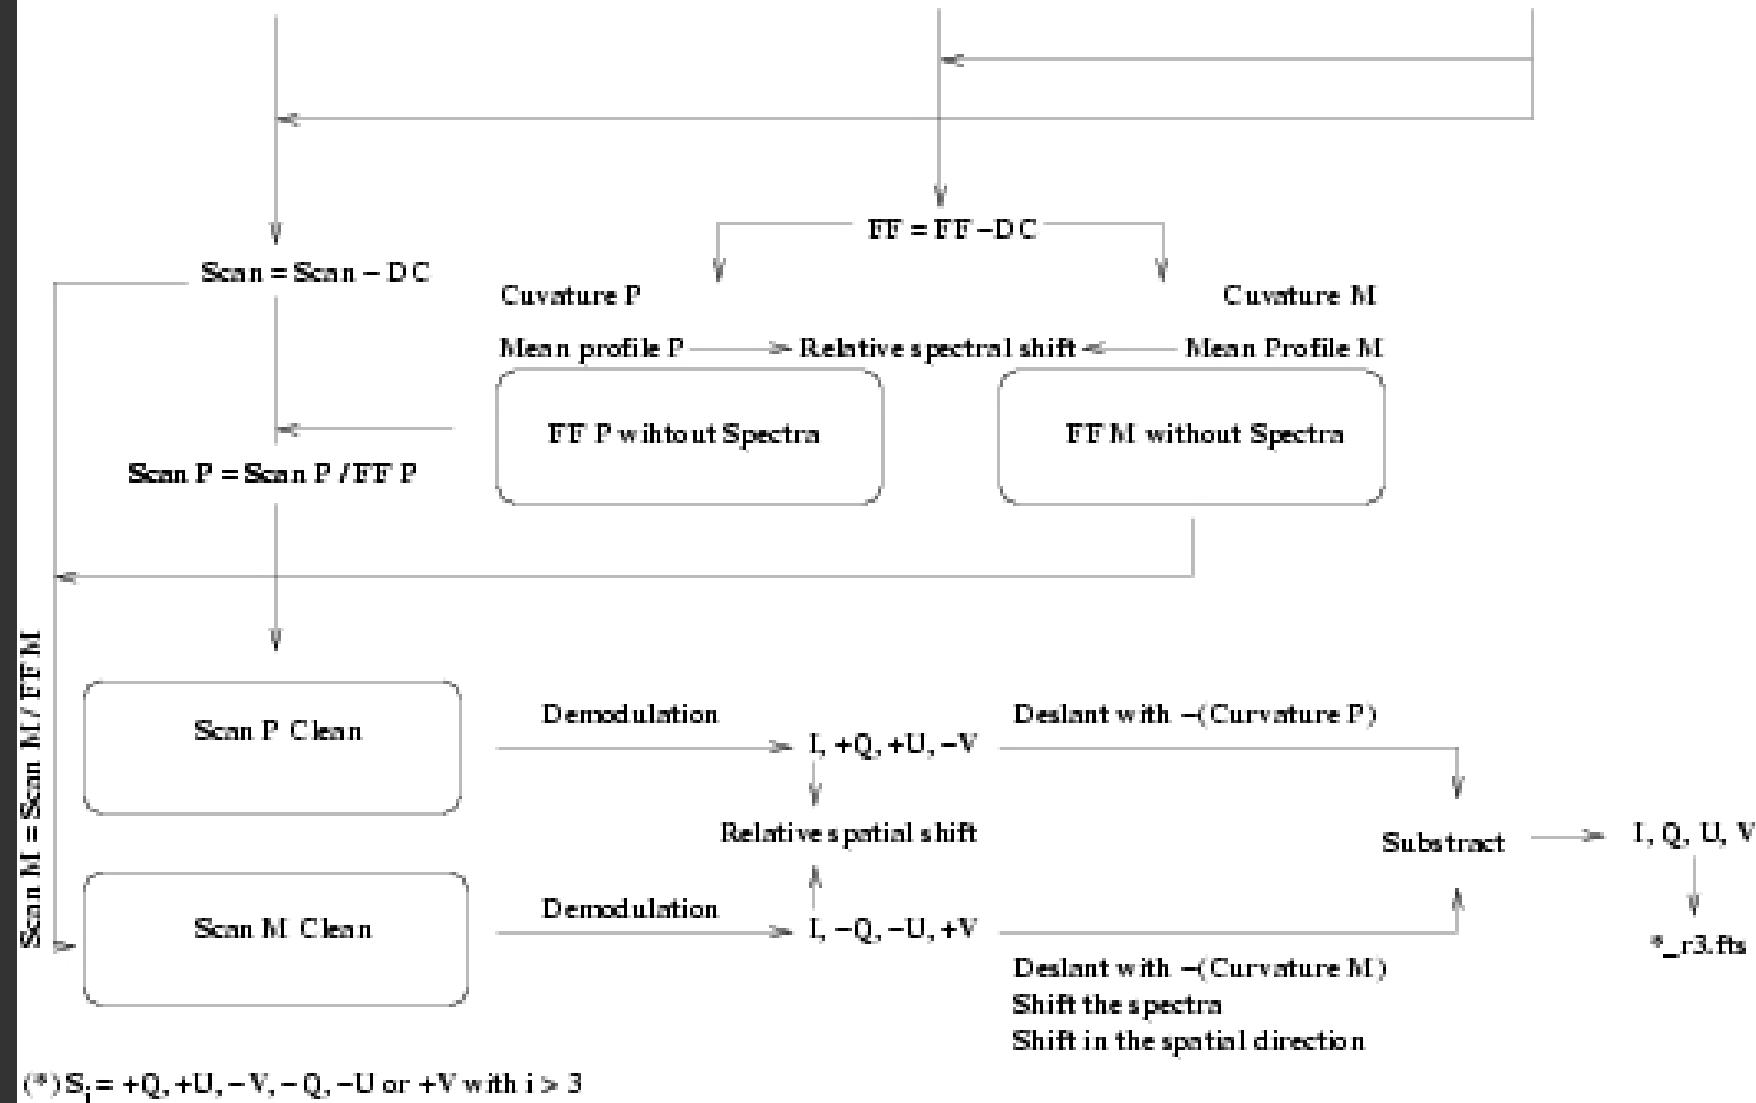

$$FF P = I + S_i$$

$$FF M = I - S_i$$

$$DC = \left(\sum_j DC_j \right) / n$$

DCP

DCM

(*) $S_i = +Q, +U, -V, -Q, -U$ or $+V$ with $i > 3$

THE DEMODULATION PROBLEM

$$\underbrace{\begin{bmatrix} I \\ Q \\ U \\ V \end{bmatrix}}_{\mathbf{s}_{in}} = \underbrace{\begin{bmatrix} M_{11,1} & M_{12,1} & M_{13,1} & M_{14,1} \\ M_{11,2} & M_{12,2} & M_{13,2} & M_{14,2} \\ M_{11,3} & M_{12,3} & M_{13,3} & M_{14,3} \\ M_{11,4} & M_{12,4} & M_{13,4} & M_{14,4} \end{bmatrix}}_D^{-1} \underbrace{\begin{bmatrix} \tilde{S}_1 \\ \tilde{S}_3 \\ \tilde{S}_3 \\ \tilde{S}_4 \end{bmatrix}}_{\tilde{\mathbf{s}}_{CCD}}$$

$$\mathbf{S} = \mathbf{D}\tilde{\mathbf{S}}$$

$$\mathbf{D}^{-1}\mathbf{S} = \tilde{\mathbf{S}}$$

$$\mathbf{A}\mathbf{x} = \mathbf{B}$$

- › Linear system determined ($n=4$) or overdetermined ($n>4$)
- › It is solved by Singular Value Decomposition and 'back-substitution' method.

HOW DOES IT WORK?

Scan_j

$$\text{Scan } P = I + S_i^{(i)}$$

$$\text{Scan } M = I - S_i$$

$$FF = \left(\sum_j FF_j \right) / n$$

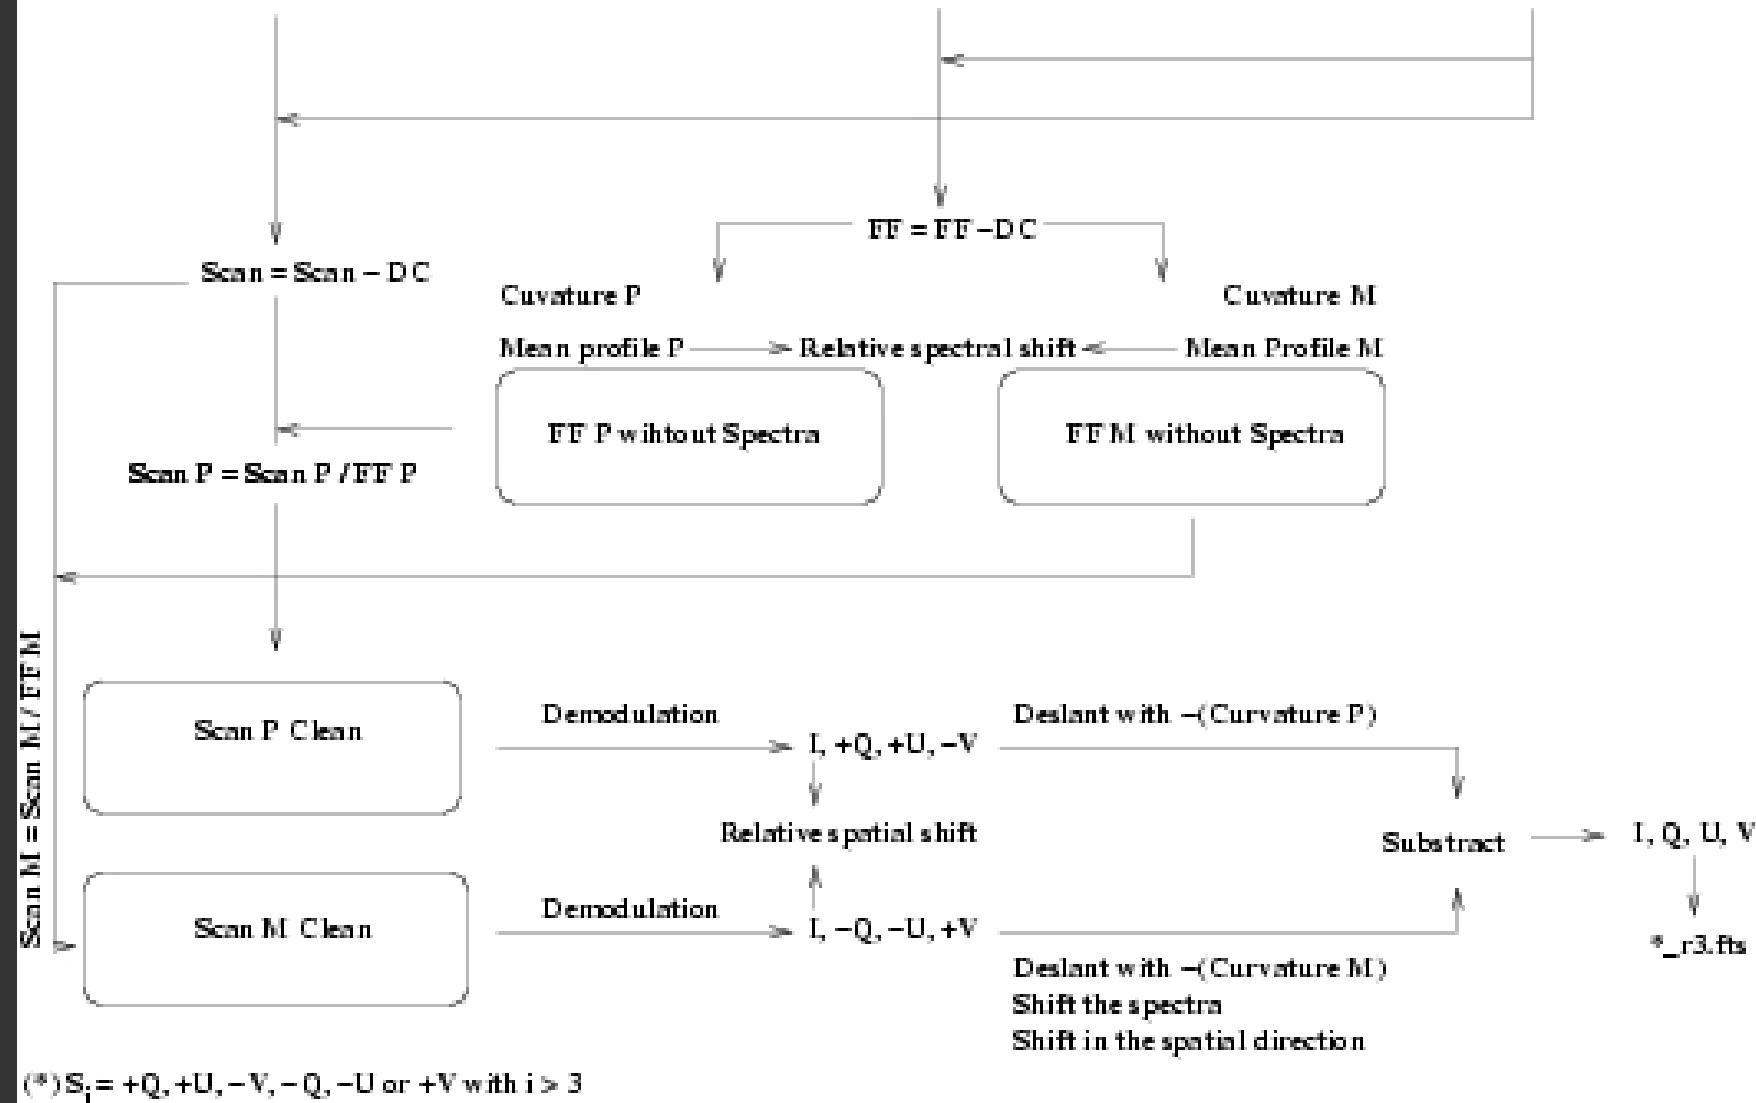

$$FF P = I + S_i$$

$$FF M = I - S_i$$

$$DC = \left(\sum_j DC_j \right) / n$$

DCP

DCM

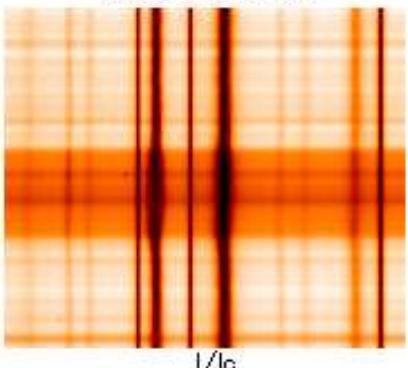

(*) $S_i = +Q, +U, -V, -Q, -U$ or $+V$ with $i > 3$

THE STOKES PARAMETERS

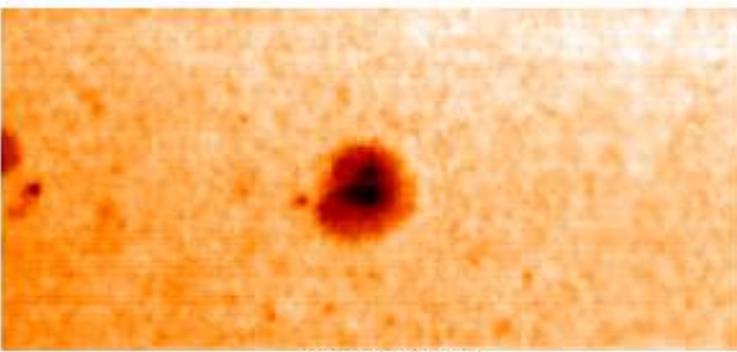

6302Å
Stokes Parameters

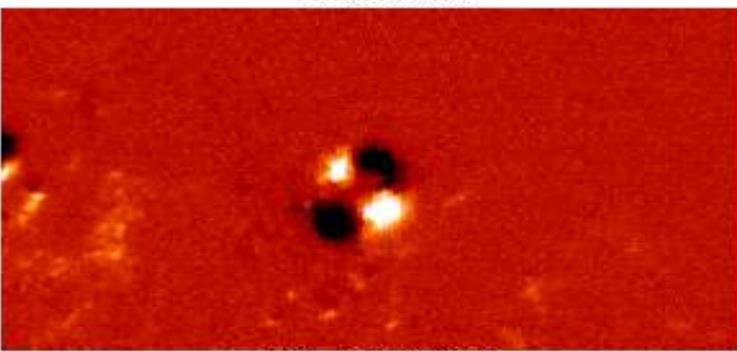

I/I_c

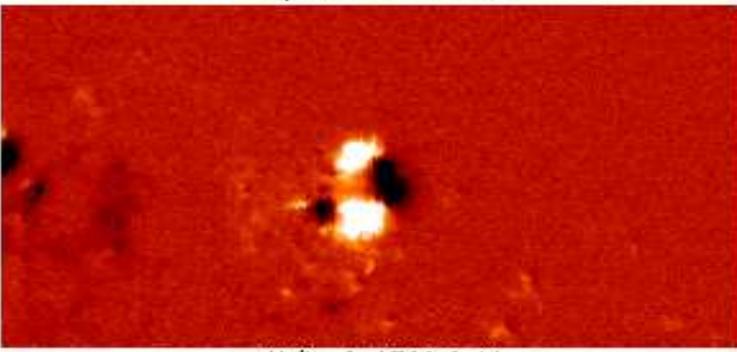

Stokes Maps from THEMIS

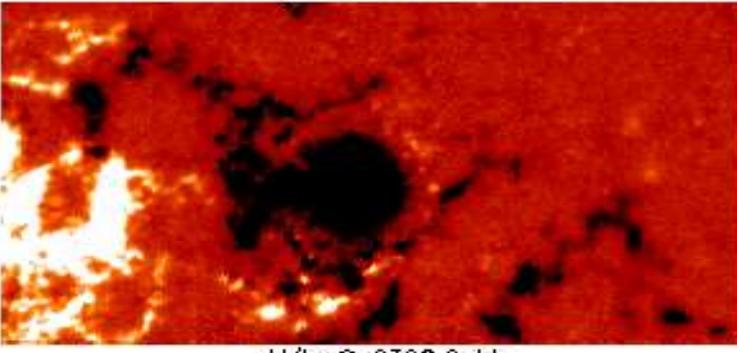

$I @ 6302.6 \text{ \AA}$

$Q/I_c @ 6302.6 \text{ \AA}$

$U/I_c @ 6302.6 \text{ \AA}$

$V/I_c @ 6302.6 \text{ \AA}$

INVERSION: PCA CODE

- ›PCA: Fast and stable
(Rees et al, 2001; Socas-Navarro et al, 2002; López Ariste & Casini, 2002, Casini et al, 2003)
- ›Limited to the Fe I 6301.5 and 6302.5 lines
- ›Milne-Eddington model atmosphere (linear source function, constant with height otherwise)
- ›Main result: Vector magnetic field with filling factor

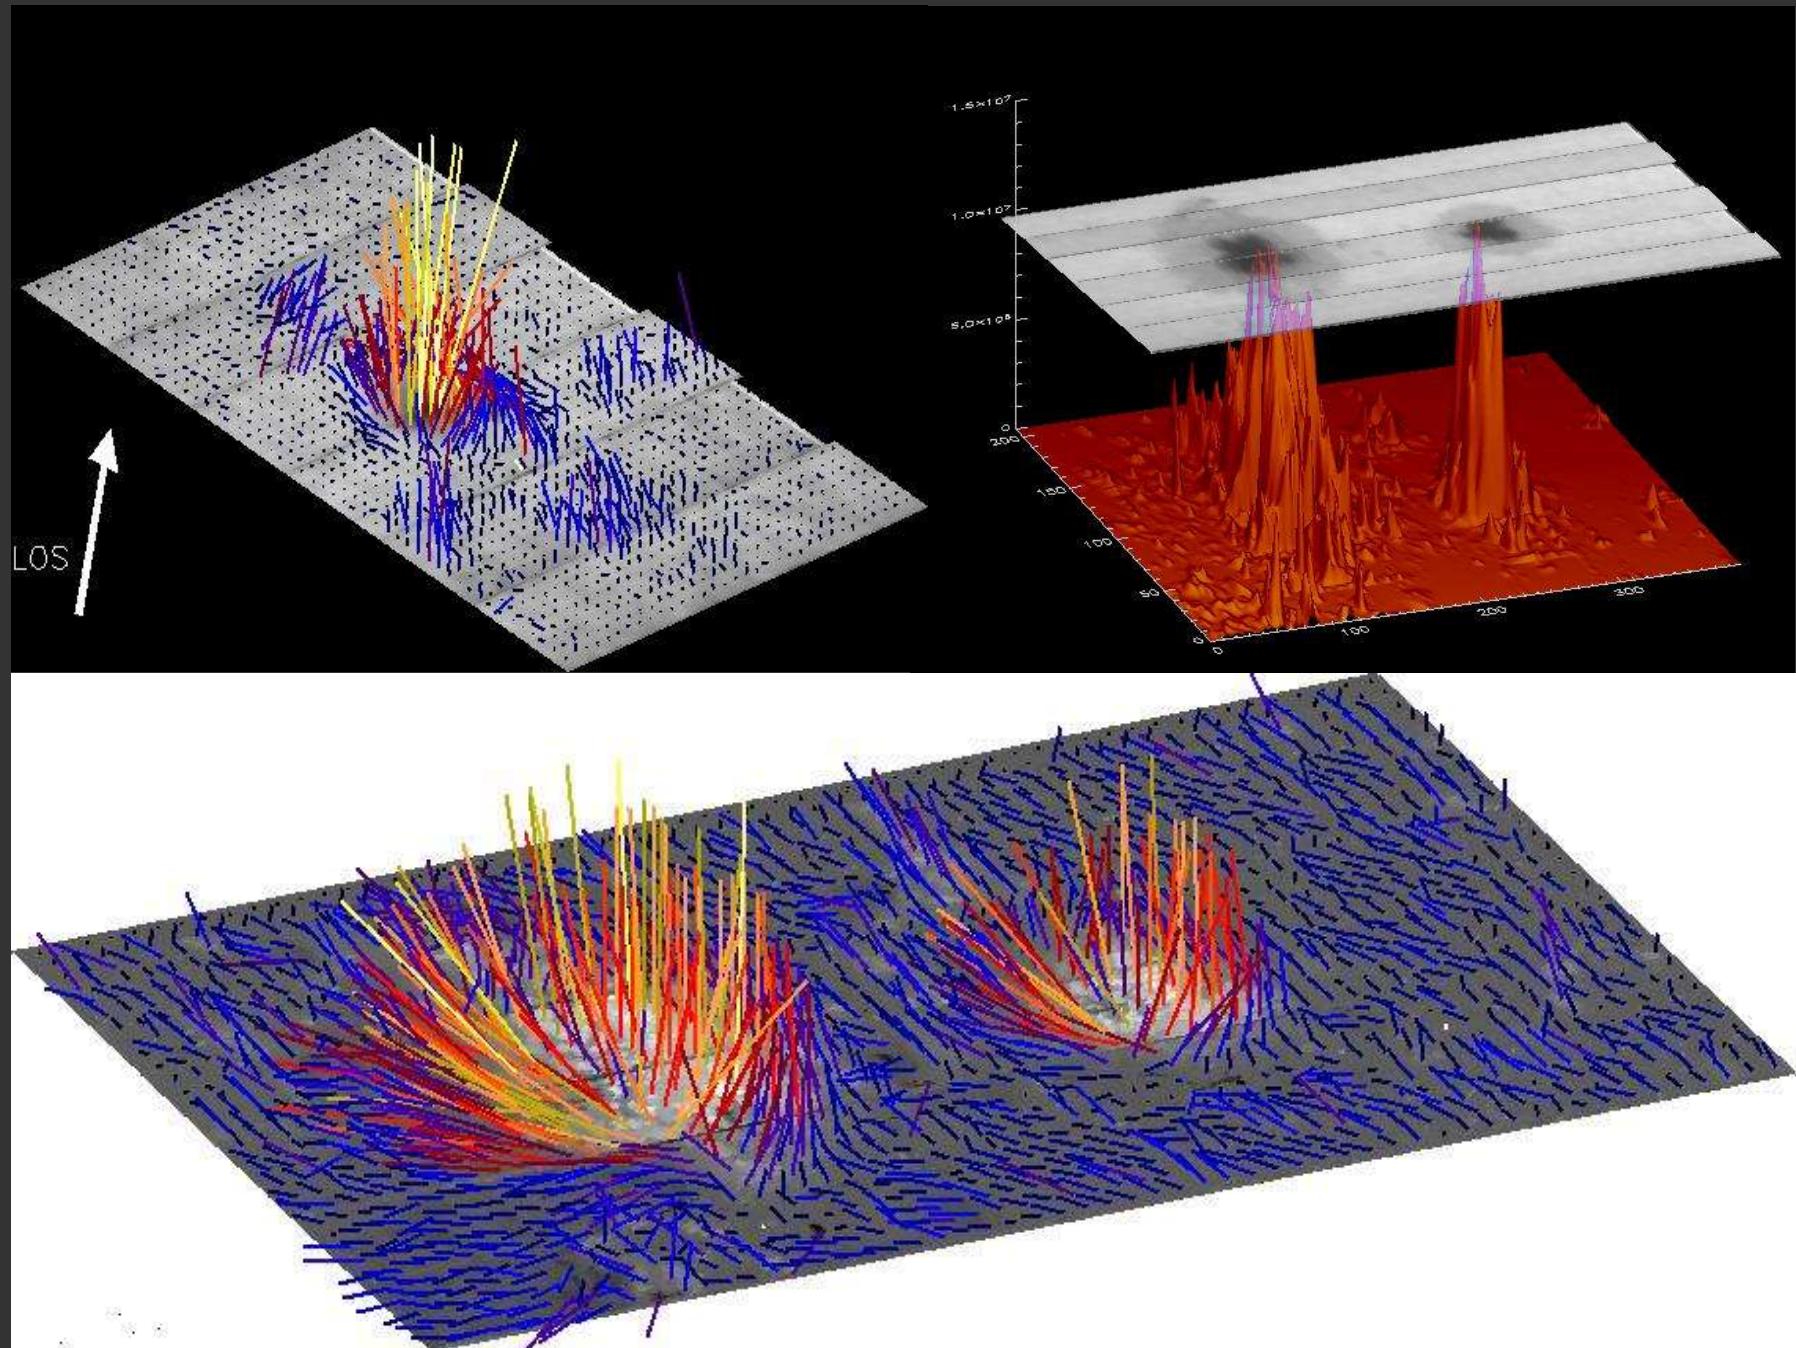

PCA implementation

- › The code uses as input the *_r3.fts files, output of the SQUV data reduction code.
- › It produces as output a *_m3.fts file producing all the THEMIS observation keywords and a 2D image for each one of the model parameters plus its error bar.
- › The PCA database is unique and not open to user modification

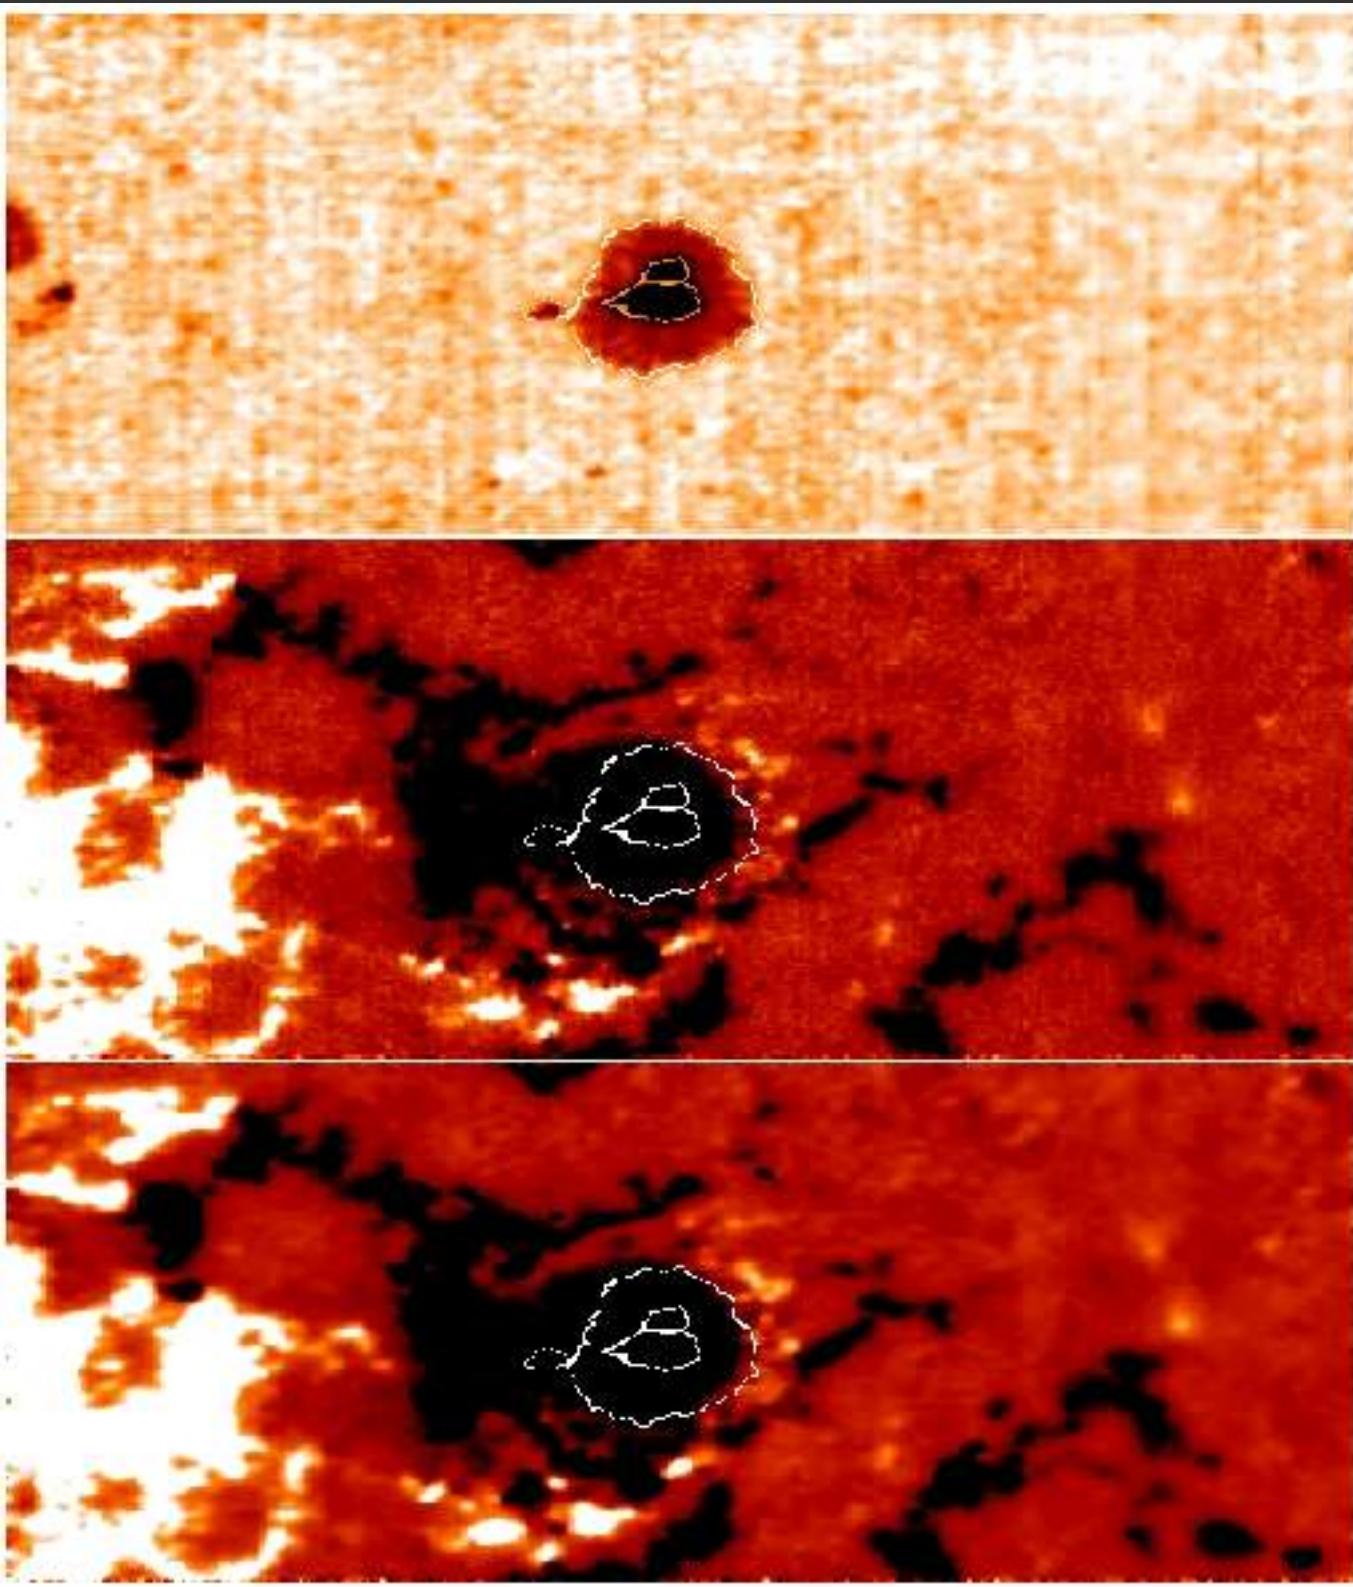

EXAMPLES: August 2004 (ASD & ALA)

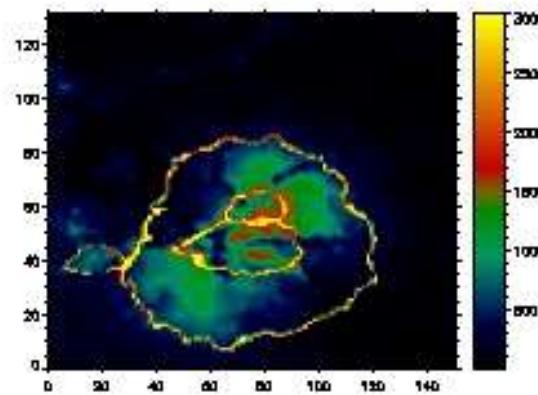

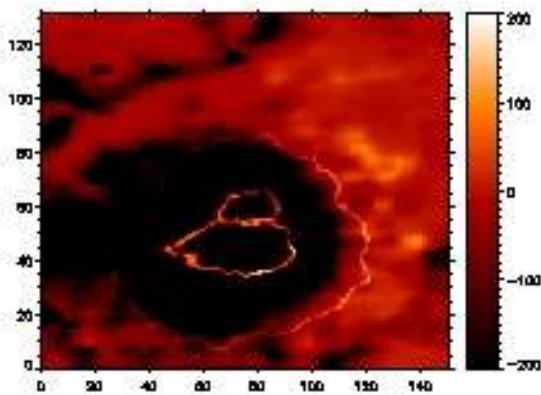

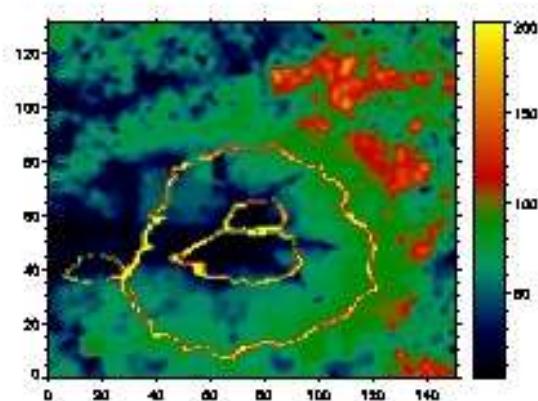

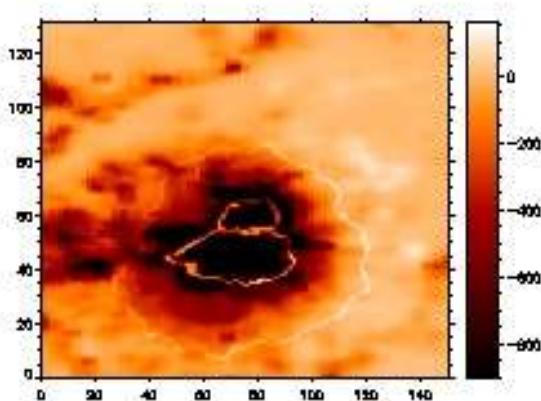

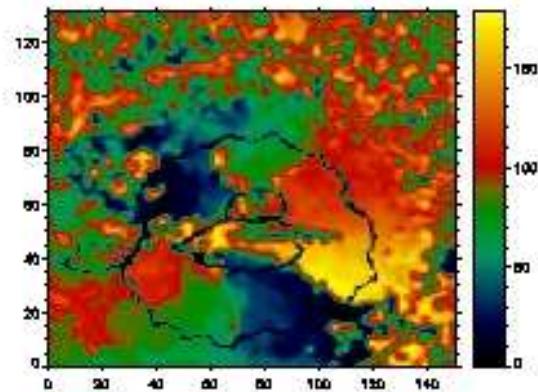

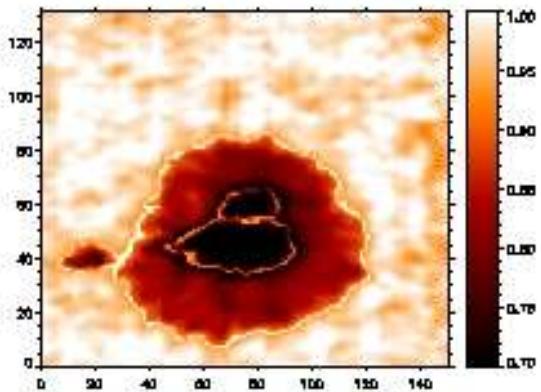

MORE EXAMPLES: Nov 2003 (VB)

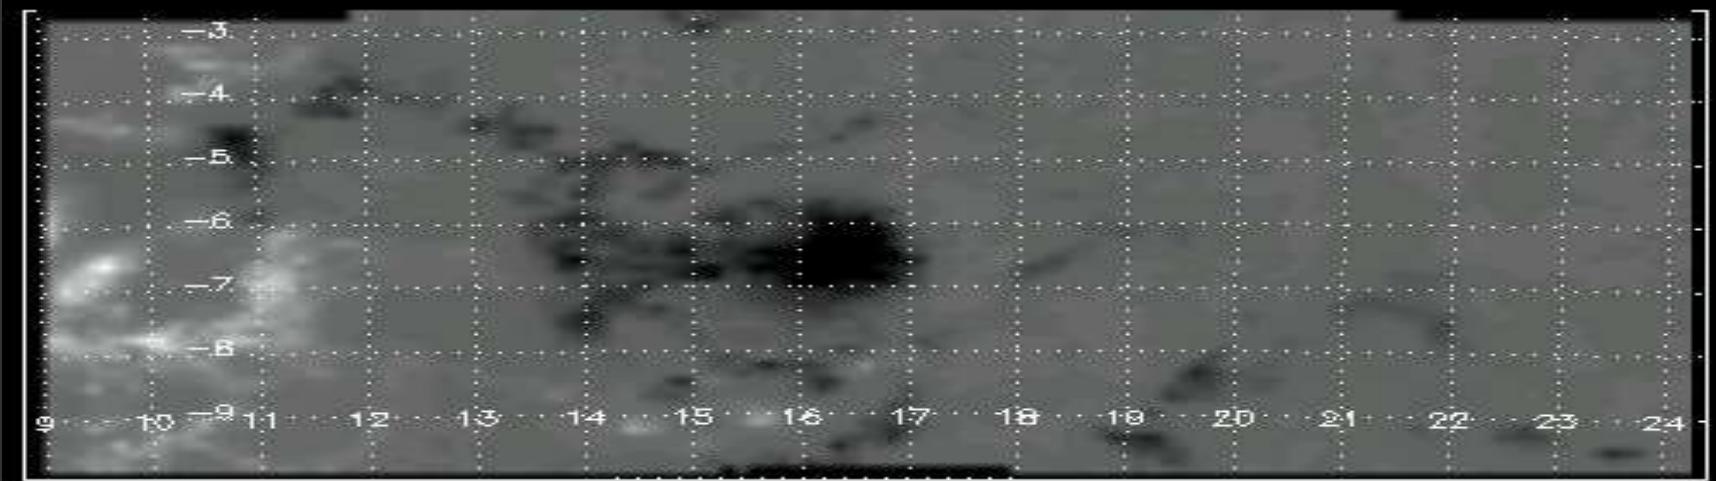

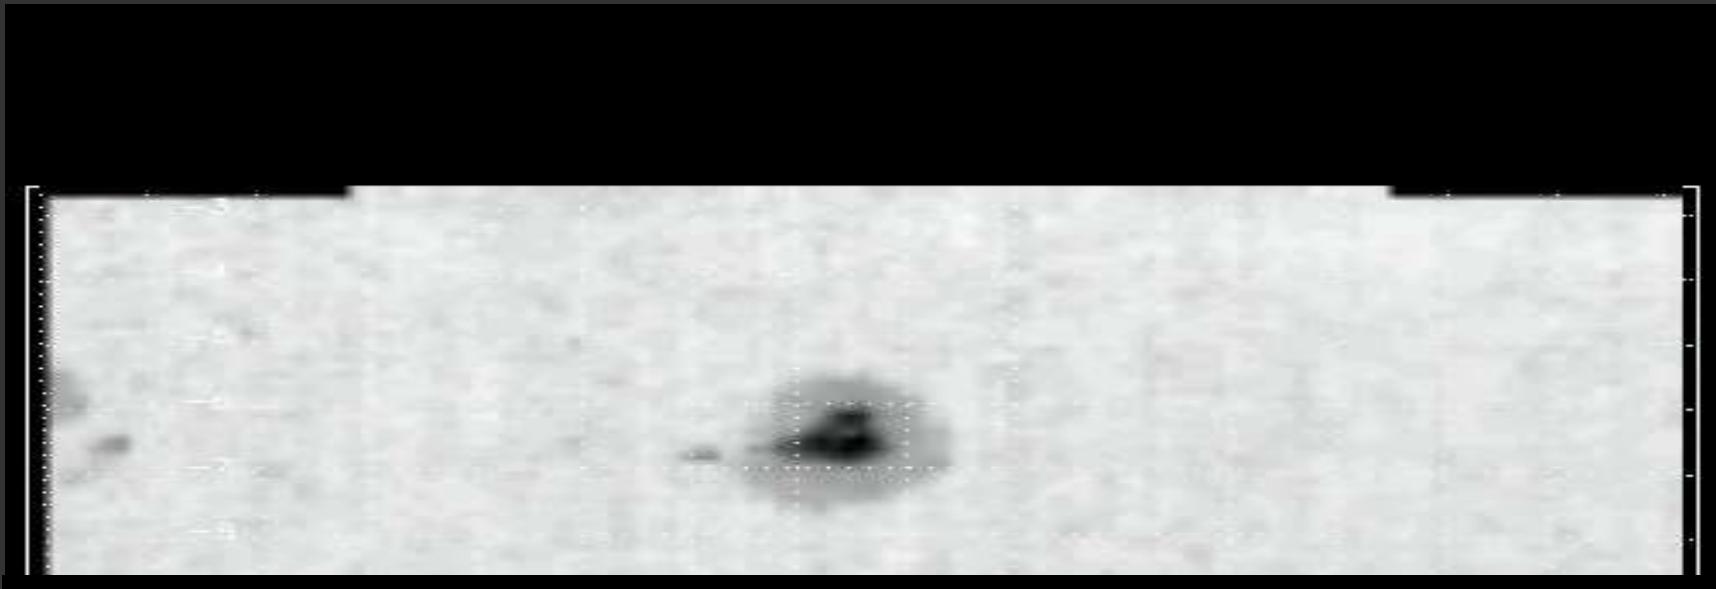

MORE EXAMPLES: Nov 2003 (VB)

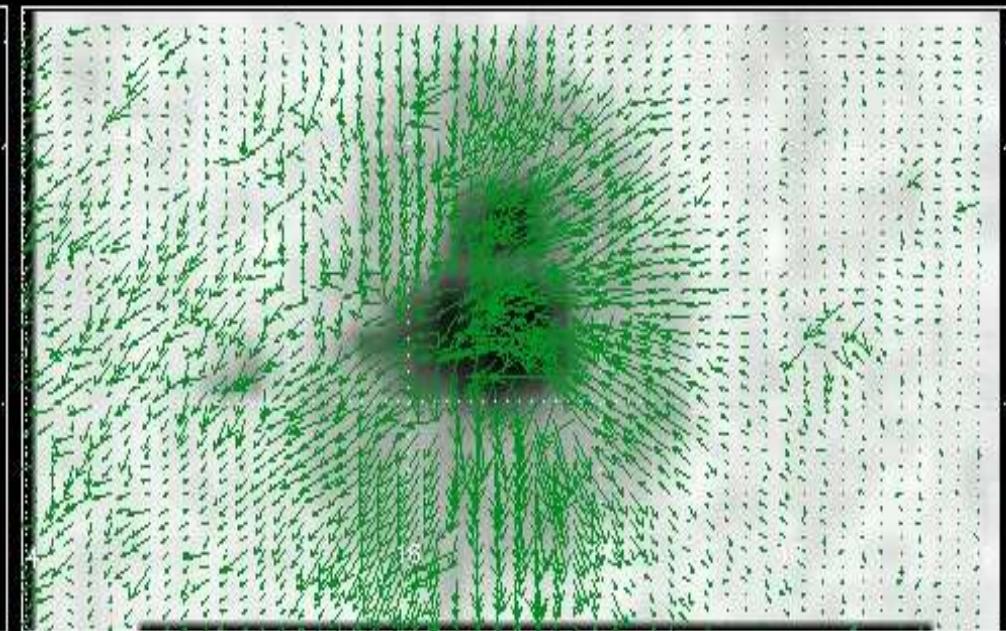

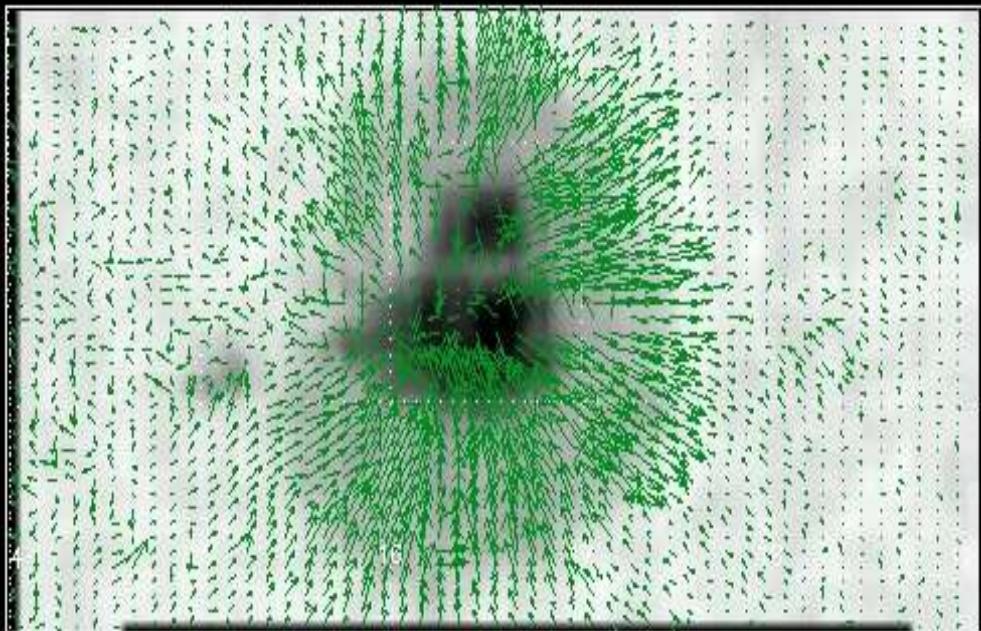

MORE EXAMPLES: November 2003 (VB)

MORE EXAMPLES: November 2003 (VB)

FUTURE...IS NOW

- › Automatic reduction: select the files, click-on 'Start SQUV'...et voilà!!!
- › SQUV & PCA are in THÈMIS acquisition chain.
- › Don't worry! Be happy! THÈMIS works for you: SQUV target in IO. PCA for Fe I 6301.5 and 6302.5 Å.
- › Maps of scans in several formats: .eps, .jpg, .fits & .sav.
- › Maps of scans on the observation logs.

FUTURE...IS NOW

- › How does the scan look? Nice!!!
- › Where has the scan been done?...on the Sun, of course!
